

Abstract

Method for brightening synthetic fibers and plastics with granulated optical
5 brighteners

A method has been found for brightening synthetic fibers and plastics. In
this method, a granulate optical brightener is incorporated into the synthetic
fibers or plastics, the granulated optical brightener being obtained via
10 compacting of an optical brightener in powder form in a pressure
compactor under a pressure of from 3 to 50 kNewton/cm of tube length and
then comminuting the resultant compactate.
